June 2017

This research was commissioned by the Western States Petroleum Association.

The LAEDC Institute for Applied Economics provides objective economic and policy research for public agencies and private firms. The group focuses on economic impact studies, regional industry analyses, economic forecasts and issue studies, particularly in workforce development, transportation, infrastructure and environmental policy.

Every reasonable effort has been made to ensure that the data contained herein reflect the most accurate and timely information possible and they are believed to be reliable.

The report is provided solely for informational purposes and is not to be construed as providing advice, recommendations, endorsements, representations or warranties of any kind whatsoever.

Executive Summary

The oil and gas industry makes a significant contribution to the California economy. Extraction, production, refining and petroleum products manufacturing result in highly tradable products both consumed domestically and exported, producing high revenues, high wage jobs and significant fiscal revenues for all levels of government.

The industry is facing changing market conditions as a result of regulatory mandates issued and under consideration in California to meet emissions goals by 2020, 2030 and 2050. These market changes are expected to impact the ability of both upstream and downstream operations to continue in the state and the available supply of petroleum and petroleum products

In this report, the Institute for Applied Economics of the Los Angeles County Economic Development Corporation (LAEDC) conducts an industry contribution analysis of the oil and gas industry as a whole in California in 2015 and concludes with forward industry linkages for petroleum refineries in California in 2015. The findings are as follows.

Oil and Gas Industry

Total Economic Contribution

The total economic contribution of the oil and gas industry in California, which includes indirect and induced activity, is presented in Exhibit ES-1.

- ▶ 368,100 direct, indirect and induced jobs
- ▶ \$33 billion in total labor income
- ▶ \$66 billion in value added, accounting for 2.7 percent of state GDP.
- ▶ \$111 billion in total output

Exhibit ES-1

Fiscal Contribution

The industry brings significant fiscal revenues to local, state and federal governments, as summarized in Exhibit ES-2.

- ▶ \$26.4 billion in state and local tax revenues
- ▶ \$15.6 billion in federal taxes
- ▶ \$28.5 billion in sales and excise taxes
- ▶ \$2.3 billion in corporate profits taxes.

Exhibit ES-2

Fiscal Contribution of Oil and Gas Industry California 2015

Type of Tax	State and Local (\$ millions)	Federal (\$ millions)	Total Tax Revenues (\$ millions)
Sales and excise taxes	\$ 21,310	\$ 7,180	\$ 28,490
Property taxes	2,650	-	2,650

Source: Estimates by LAEDC

Total Economic Contribution by Industry

Each oil and gas industry is associated with its own distinct set of activities, which ripple through the California economy with different magnitudes. Exhibit ES-3 shows the distribution of the total economic contribution of the oil and gas industry by component industry.

Exhibit ES-3

Total Economic Contribution by Industry California 2015

- Oil and gas extraction
- Oil and gas: drilling wells and mining support
- Natural gas distribution
- Oil and gas field machinery/equip mfg
- Oil and gas: pipeline/related structures construction
- Pipeline transportation
- Petroleum refineries
- Petroleum lubricating oil/grease/petrochemicals mfg
- Petroleum and petroleum prods wholesale
- Fuel dealers
- Gasoline stations

Characteristics of the Workforce

The industry employs individuals with a broad range of characteristics exhibiting some notable trends:

- ▶ The workforce is ethnically and racially diverse, with 50.2 percent white, 29.1 percent of Hispanic origin and 13.0 percent Asian.
- ▶ Men in the workforce outnumber women by more than two to one.
- ▶ Almost three-quarters of the industry's workforce is in its prime working age—between 22 years and 54 years of age, although workers aged 55 years and older still accounted for 24.5 percent, a significant share of the industry workforce.
- ▶ A diversity of employment opportunities is available across the educational attainment spectrum:
 - Approximately 23 percent of workers have a bachelor's degree or higher;
 - Almost 30 percent have some college, post-secondary certification or an associate's degree; and
 - Just under 40 percent of all workers have high school credentials or less.
 - Across all levels of attainment, earnings are higher in oil and gas industries compared to the all industry average.

California Refineries

Backward Linkages

Backward linkages of the refinery industry trace its purchases of goods and services in its supply chain and its payment of labor income. These are quantified using contribution analysis. The total economic contribution of the refinery and petrochemical industry in California, which includes all indirect and induced activity, is: presented in Exhibit ES-5.

- ▶ 107,270 direct, indirect and induced jobs
- ▶ \$10.4 billion in total labor income
- ▶ \$29.0 billion in value added, accounting for 1.9 percent of state GDP.

Forward Linkages

Many industries are directly dependent on refinery and petrochemical products in their production processes and will be exposed to the risk of cost increases, relocation or closure should there be a reduction in the availability or increase in the prices of these products. *Forward linkages* are the industries that purchase petroleum products as inputs. These primary user industries of the refinery and petrochemical industry represent significant economic activity which is at risk, as shown in Exhibit ES-6.

- ▶ 1.7 million jobs (7.6 percent of state total)
- ▶ \$111 billion in labor income
- ▶ \$207 billion in value added, accounting for 8.4 percent of state GDP.

In addition to the refinery industry itself, all twenty-one California manufacturing industries (at the 3-digit NAICS level) are vulnerable and will be most at risk. ❖

1 Introduction

The U.S. economy is incredibly dependent on the oil and gas industry. Operating in a global market, demand, supply and prices are influenced by what takes place worldwide, not just nationally. Extraction, production, refining and related manufacturing result in highly tradable products consumed domestically and exported to satiate global demand. As a result, the oil and gas industry is associated with high revenues and high wage jobs.

As finite natural resources, fossil fuels are heavily regulated as their extraction, production and refining have consequences for the environment and depletion of these resources could be calamitous for the energy needs of future generations. Taxes are levied on the industry in a variety of ways to mitigate these risks, resulting in public revenues that are larger than those collected from other industries.

The regulatory mandates that have been issued and are under consideration by the state of California to meet emissions goals in 2020, 2030, and 2050 are changing the market faced by the industry. The ability of in-state oil production and refinery operations to continue and the available supply of petroleum products will be affected.

The potential reduction of the in-state supply of crude oil and refined petroleum products and byproducts will impact thousands of businesses that depend on these products in their production processes, impacting production costs and leading to higher prices of end products—which themselves may be used in other industries as inputs into production.

In this report, the Institute for Applied Economics of the Los Angeles County Economic Development Corporation (LAEDC) estimates the economic and fiscal contribution of the oil and gas industry in California, and conducts a regional dependency study of the refinery industry, which evaluates the ripple effect of a potential reduction of supply of refined petroleum products and byproducts in California. The report is presented in nine parts.

This introductory section provides a short description of the industry definition and sub-regions used in the contribution analysis. Additional details and methodology can be found in the appendix.

Section 2 provides a brief overview of the oil and gas industry in California, including upstream and downstream activity. Section 3 examines the state's oil and gas industry's workforce.

Section 4 provides an analysis of the oil and gas industry's total economic and fiscal contribution to the state of California and a discussion of the public revenues attributed to the industry and the consumption of its products.

Section 5 provides analysis at the sub-regional and county levels, and provides contributions for most counties in California.

Section 6 quantifies the direct economic activity associated with the refinery industry in California, such as its direct employment and output, and then estimates the total contribution of the industry through its supply chain. This contribution represents the industry and its *backward linkages*. Then refinery industry products are traced through the industry user chain. A *vulnerability index* is constructed to evaluate each industry's exposure to refinery products. The top twenty primary user industries most vulnerable to potential supply disruptions are quantified, providing an order of magnitude estimate of the economic activity that is at risk from reduction of supply of refined petroleum

products based on the *forward linkages* of the refinery industry in California.

Section 7 provides an analysis for each of the top twenty most vulnerable primary user industries. Employment, labor income, output and direct contribution to GDP are estimated to provide orders of magnitude of the economic activity that is at risk from reduction of supply of refined petroleum products and byproducts.

Section 8 identifies employment in industries at risk, user industries that rely upon refinery products in their supply chain, or who are users of the dependent industry's output. Jobs at risk are identified at the county level and congressional district level.

Section 9 includes detailed sheets for each county in California for the economic contribution of the oil and gas industry, and the number of jobs in industries identified as most at risk from potential refinery supply disruptions.

Detailed tables as referenced in the text can be found in the Appendix. ❖

Oil and Gas Industry Definition

The North American Industry Classification System (NAICS) was created to track economic activity for businesses at the establishment level. Each establishment is grouped according to its primary activity. The thirteen NAICS codes included in the definition of the oil and gas industry used in this report are listed in Exhibit 1-1. These are described in detail in the Appendix. ❖

The Sub-Regions of California

For purposes of exposition, California is divided into four sub-regions, which are shown in Exhibit 1-2 and defined below.

Southern California

This sub-region includes the following six counties: Imperial, Los Angeles, Orange, Riverside, San Bernardino and San Diego.

San Francisco Bay Area

This sub-region includes the following nine counties: Alameda, Contra Costa, Marin, Napa, San Francisco, San Mateo, Santa Clara, Solano and Sonoma.

Central Coast

This sub-region includes the following four counties: Monterey, San Luis Obispo, Santa Barbara and Ventura.

Central Valley/Northern California

This sub-region includes the following sixteen counties: Butte, Colusa, Fresno, Glenn, Kern, Kings, Merced, Sacramento, San Joaquin, Shasta, Stanislaus, Sutter, Tehama, Tulare, Yolo and Yuba.

The remaining 23 counties are contained in Rest of State. ❖

2 The Oil and Gas Industry in California

California's oil and gas industry continues to produce energy for its residents and businesses, as well as for those in the rest of the nation. The oil and gas industry remains a high-wage industry in the state. However, strict regulations and pressure on prices prevented job growth from further advancing in 2015.

Upstream Activity

Production, which includes the drilling and pumping of crude oil and natural gas, are upstream operations in the oil and gas industry. According to the Energy Information Administration (EIA), global crude oil consumption in 2015 was 93.88 million barrels per day.

The oil and gas extraction industry is sizeable in California. Active wells are distributed across the state, but the majority of them are located in the Central Valley/Northern California sub-region, as shown in Exhibit 2-1.

Exhibit 2-1
Active Wells in CA by Sub-Region 2015

Crude Oil

U.S. oil field production totaled just over 3.4 billion barrels in 2015. Exhibit 2-4 shows the highest oil producing states in the nation ranked according to their crude oil production in 2015. California produced 201.3 million barrels, representing 10.3 percent of total national production. Out of the 31 oil producing states nationwide, California ranks fourth.

Previously, California had ranked third in crude oil production and Alaska followed, but changes to the tax law in Alaska (passed in 2013) provided incentives to pursue more drilling and well work, and has resulted in increased production which elevated its ranking over that of the golden state.

Exhibit 2-4
Crude Oil Production 2015
(Thousands of barrels)

The distribution of California crude oil production in 2015 according to sub-region is shown in Exhibit 2-5.

Exhibit 2-5**Oil Production by Sub-Region 2015**
(bbl in millions)

While crude oil production activity occurs throughout the state, the Central Valley/Northern California sub-region accounted for close to 80 percent of total California production. The second and third largest producing sub-regions were Southern California and the Central Coast, with 14 percent and 11 percent respectively.

Natural Gas

Natural gas production in the U.S. totaled 28.8 trillion cubic feet in 2015. California produced 231.1 billion cubic feet, accounting for 0.8 percent of total U.S. production. Out of the 33 natural gas producing states nationwide, California ranks fifteenth. Exhibit 2-2 displays the highest ten ranking states and California according to their total natural gas production in 2015.

The distribution of California natural gas production in 2015 by sub-region is shown in Exhibit 2-3.

Exhibit 2-2**Natural Gas Production 2015**
(Cubic feet in millions)**Exhibit 2-3****Gas Production by Sub-Region 2015**
(cubic feet in millions)

Similar to crude oil production, the Central Valley/Northern California sub-region also accounted for approximately 80 percent of total California natural gas production in 2015, followed by The Central Coast and Southern California, each producing an additional eight percent. ❖

Downstream Activity

Petroleum refineries are downstream operations in the oil and gas industry. The refining of crude oil produces highly tradable products consumed domestically and exported to global markets. According to the Energy Information Administration (EIA), global crude oil consumption in 2015 was 93.88 million barrels per day. Byproducts of the refining process include petrochemicals, which are used to manufacture a wide variety of different goods, including medical and personal products, fuel and lubricants, chemical products, synthetic fabrics and materials, and more (see Exhibit 6-1 for a more comprehensive listing).

The petroleum refining industry also has a large presence in California. As of January 1, 2015, annual operable atmospheric crude oil distillation capacity in California was just over 1.9 million barrels per calendar day (bpcd), ranking third among states and representing 11 percent of total U.S. capacity of 17.8 million bpcd (Exhibit 2-6). From 2014 to 2015, crude oil distillation capacity in California increased by 1.4 percent, adding 26,300 bpcd, a faster rate of increase than the U.S. as a whole with a distillation capacity increase of only 0.2 percent over the year.

Exhibit 2-6**Crude Oil Distillation Capacity 2015**

Annual Operating Atmospheric (bpcd)

Source: EIA

Despite the prominence of the state in terms of the national industry, the number of refineries in California has been decreasing over the years due to emissions related regulations, which would otherwise require refineries to make large expenditures on equipment, modifications and upgrades. Operations that are unable to merge or consolidate to fund these investments have ceased operations. This has resulted in the closure of older and smaller refining operations that found compliance with the state's strict environmental regulations to be cost prohibitive. This is also limiting the permitting of new facilities, and therefore, any potential increase in oil refining capacity in the future to meet upcoming needs in California appears highly unlikely.

There were 18 operable refineries in 2015, less than half of the number of operable refineries in 1985 (Exhibit 2-7). The number of operable refineries in California has remained constant at 18 since 2012.

Exhibit 2-7**Number of Refineries in CA**

Source: EIA

Refineries in California are located largely within two sub-regions: Southern California (primarily Los Angeles County) and the San Francisco Bay Area.

Exhibit 2-8 displays the crude oil refining capacity in California by sub-region as of December 2015. Total statewide refining capacity was approximately 1.9 million barrels per calendar day. Southern California accounts for more than half, and the San Francisco Bay Area accounts for another 44 percent of total refining capacity.

Exhibit 2-8**Refining Capacity in CA by Sub-Region 2015**

Atmospheric Crude Distillation Capacity

(Operating Capacity in BPCD)

Source: CA Energy Commission

Although the number of refineries have been declining in both California and the nation as a whole, expansions of existing operations and increases in efficiencies have resulted in increased capacity nationwide (Exhibit 2-9).

Exhibit 2-9**Annual Operating Refinery Capacity in U.S.**

(barrels per calendar day)

Source: EIA

However, unlike the national experience, overall operating capacity in California has not seen a consistent upward trend. Despite an increase in refinery capacity of 17.1 percent in 2015 over that in 2013, there remains an overall loss of 178,130 bpcd capacity (a decline of 8.6 percent) since 1985 (Exhibit 2-10).

Exhibit 2-10

Annual Operating Capacity in CA
(barrels per calendar day)

Oil Supply Sources

The requirements for fuel consumed in California are highly specific. In order to meet demand, California refineries operate at or near maximum capacity. Due to limits placed on in-state production, refineries import crude oil sourced from Alaska and outside the U.S. Production volumes from domestic sources have been declining over the years, leading to increasing amounts of foreign crude being delivered to marine terminals in the San Pedro and San Francisco ports to augment the supply of crude which is constrained locally.

Exhibit 2-11 shows the total supply of crude oil to petroleum refineries in California by source from 1985 through 2015. In 2015, crude oil from foreign sources represented just over half the oil supplied to refineries in the state.

Exhibit 2-11

Oil Supply Sources to CA Refineries

* CA totals may also include minor amounts from Gulf Coast States
Source: CEC, aggregated from PIRRA data

The specificity of the requirements for fuel and the growing reliance upon foreign crude oil sources leave consumers at the pump in California vulnerable to short-

term fluctuations in oil prices and supply shocks resulting from unplanned disruptions during refinery outages.

The Supply Shock

Each year, California transitions from winter-grade to spring-grade gasoline and from spring-grade to summer-grade gasoline. The cost to manufacture the warmer weather blends is higher than that to manufacture the winter-blend. Regardless of the blend, the cost of manufacturing gasoline to state specifications exceeds that of conventional gasoline used outside of California.

Blendstock transitions also reveal price volatility. Immediately preceding a transition from one seasonal gasoline blend to another, prices will either increase or decrease according to inventory levels; they will rise when inventory is low to delay a badly timed purchase, or will drop to accelerate sales of the current blend if inventory is deemed high.

In the event that capacity is reduced further, and local production cannot meet local demand due to more aggressive restrictions, additional product must be imported into the area. Costs for petroleum and petrochemical products produced out of state will be higher due to increased shipping costs and costs associated with out-of-state producers reconfiguring and refitting facilities, a costly and labor-intensive undertaking that will be required to accommodate California's specific blends of low sulfur gasoline and diesel.

Both industries and individual consumers will feel these additional costs. Dependent industries that use petroleum and petrochemical products as an input in production or are heavily reliant upon these products in the provision of a service, such as transportation industries, may not be able to absorb the increases. Consumers will feel cost increases that cannot be absorbed by the industry at the pump or when they purchase transportation services or petroleum based end products.

California is Leading the Way

High costs are in part due to California's stringent environmental standards. California has long been heralded for its leading role in renewable energy and environmental issues. According to Governor Jerry Brown, "California has the most far-reaching environmental laws of any state and the most integrated

policy to deal with climate change of any political jurisdiction in the Western Hemisphere.”

Market conditions for refined petroleum products and byproducts produced in-state continue to change as a result of regulatory mandates issued to meet increasingly more ambitious emissions goals. Existing environmental regulations, undertaken as a means for California to achieve its larger 2020, 2030 and 2050 climate change goals, may already be limiting the permitting of new petroleum refining facilities, making any potential increase in oil refining capacity in the future in California highly unlikely. These new changes in the refined petroleum products and byproducts market are expected to further impact the ability of refinery operations to continue in the state.

In his January 2015 inaugural address for his fourth term as governor of the state of California, Jerry Brown identified three main goals to be achieved by 2030, the second of which included cutting current petroleum use in cars and trucks (an estimated 16 billion plus gasoline gallons equivalent in 2014) by half. While this measure stalled in the Assembly (SB 350), new climate legislation (SB 32) was passed that extended AB32 goals out to 2030, with a new target of 40 percent below 1990 levels by 2030, building upon the momentum of the previous target of meeting 1990 levels by 2020.

Despite the stripping of the 2050 goals from SB 350, the fifty percent reduction remains an objective of the governor. Under CARB's authority and a renewal of the Low Carbon Fuel Standard (frozen since 2013), regulations to cut methane and hydrofluorocarbon emissions by 40 percent and black carbon by 50 percent by 2030 have been approved to move forward. Additional options to extend and toughen GHG reductions in California exist for Brown besides legislative bills and CARB's authority, mainly the option to place initiative measures on the state ballot in the 2018 election, allowing voters to weigh in.

Oil and Gas Industry Employment Trends

The oil and gas industry has proven itself to be valuable to the state's economy in that its employment has been more resilient than other private industries as a whole. While it does react to contractions in the economy, the magnitude of these reactions are milder than those experienced by other private industries.

Exhibit 2-12 displays the private payroll employment in the oil and gas industry as a whole and for all other private industries in California, indexed to 2001

employment levels. Values of 100 mean that the employment level is equal to that seen in the base year (2001).

Exhibit 2-12

California Oil and Gas Industry
Employment in Context

Source: CA EDD; Estimates by LAEDC

The Great Recession caused private employment levels to dip below that of the base year and has rebounded, posting a consistent gain from the lowest level in 2010, and exceeding the pre-recession peak by five percent in 2015.

In contrast, the oil and gas industry exhibited more post-recession buoyancy; the industry rebounded from the lowest level, also in 2010, to base year levels a year earlier than other private industry and beating the prerecession peak starting in 2012. Oil and gas industry employment declined by nearly two percent in 2015

after four consecutive years of growth, most likely a result of low crude prices; however, the current level still exceeds the pre-recession peak by two percent.

Another feature of the oil and gas industry is the higher annual wages paid in most component industries, as shown in Exhibit 2-13. With the exception of petrochemical manufacturing, fuel dealers and gasoline stations, wages in each of the component industries listed exceed the average annual wage in the state.

Exhibit 2-13

**Oil and Gas Industry Wages
California 2015**

NAICS	Industry	Ave Annual Wage
211111	Crude petroleum/natural gas extraction	\$ 109,536
211112	Natural gas liquid extraction	102,476
213111	Drilling oil and gas wells	80,143
213112	Support activities for oil and gas operations	75,422
2212	Natural gas distribution	124,086

Oil and Gas Industry		\$ 84,451
All other private industries		61,030
All private industries in CA		\$ 61,276

Note: Excludes non-employers and independent contractors

Source: CA EDD; Estimates by LAEDC

The industry operates in close geographic proximity to wherever reserves are found—often in rural areas with limited industry. Without a diverse economic base, these rural areas typically have challenges in attracting and sustaining other industries. Oil and gas industries provide much needed employment opportunities with higher than average wages, translating into larger indirect and induced effects that ripple throughout the economy. ❖

The Employment and Price Relationship

Increased domestic oil production resulting from horizontal drilling techniques and fracking combined with high levels of output by the Organization of Petroleum Exporting Countries (OPEC) has led to a global supply glut that has put downward pressure on

crude oil prices. Low oil prices translate into increased expendable income for consumers, but for the oil and gas industry, extended periods of low prices result in decreased activity in extraction and refinery operations and, consequently, job cuts.

Jobs cut are not limited to those working in actual oil fields and refineries, companies in oil and gas industries looking to decrease their payrolls also shed workers in office admin roles, IT staff, workers in finance and legal, and in marketing. As oil production declines, new drilling and other projects are put on hold, whose negative effects then ripple out to companies in their energy supply chain such as equipment manufacturers, shippers and construction crews.

Exhibit 2-14 shows annual average payroll employment in the oil and gas industry in California from 2001 through 2015, overlaid with annual average spot prices for the West Texas Intermediate (WTI) and Brent Price.

Exhibit 2-14

Payroll Jobs and Spot Prices FOB (\$US per barrel)

Source: EIA, estimates by LAEDC

Mid-2014 marked the beginning of a precipitous fall in the price of oil that continued through 2015, where annual averages of spot prices for both WTI and the Brent Price experienced their lowest annual averages since 2005. From 2014 to 2015, payroll employment in the oil and gas industry in California lost just over 2,600 jobs, the industry's first employment decline after four consecutive years of growth.

Low oil prices have gone hand in hand with a buildup of inventories in both crude and other liquids. When oil prices start to rise, inventories will be worked through prior to bringing increased levels of production back on line. This means that any gains in employment associated with a price increase will lag slightly behind as well.

3 California's Oil and Gas Industry Workforce

The oil and gas industry employs a large number of people in California, providing a myriad of employment opportunities for a diverse group of individuals. As job duties vary, so do the required skills and education levels for job entry. Wages vary with occupations in the industry, with many associated with high wages.

Industry Occupations

An occupation is classified according to the set of activities or tasks that an employee is paid to perform. Some occupations are specific to an industry, but others exist in a number of different industries, for example, customer service representatives, salespersons, accounting staff and receptionists.

Occupations are classified by the Standard Occupational Classification (SOC) System. Workers fall into one of 840 detailed occupations, which are combined into 23 major groups. Each occupation requires its own skill set and education levels. The distribution of employment by major occupational group specific to the oil and gas industry in California is displayed in Exhibit 3-1.

Exhibit 3-1
Occupational Distribution of Oil and Gas Industry

Over forty percent of workers in the industry are employed in sales occupations, another 20 percent in office and administrative, business and financial, and management occupations combined, and just over a quarter work in occupations in construction and extraction, production, installation and maintenance, and transportation and material moving.

It should be noted that this occupational distribution includes individuals employed at gas stations. Gas stations represent the retail side of the oil and gas industry and account for a large share of industry employment. Activities taking place at retail gas stations are dissimilar to activities taking place in other oil and gas industries, many of which involve production and distribution.

Including gasoline stations in an occupational analysis skews average annual wages of occupations in the oil and gas industry and the occupational composition of the oil and gas industry. Many gas station jobs require lower skills levels and are associated with average annual wages significantly lower than found in other oil and gas industries. This skewing is evident in the next exhibit as the oil and gas industry outside of gasoline stations is reviewed. (The gas station industry is shown separately in the following section.) Exhibit 3-2 shows the distribution of employment in the California oil and gas industry by major occupational group excluding the gasoline stations.

Exhibit 3-2**Occupational Distribution of Oil and Gas Industry**
(Excluding gas station industry)

Excluding the gasoline stations, the largest share of the oil and gas workforce is employed in office and administrative occupations, which includes bookkeepers and accounting clerks, utility meter readers, office clerks, stock clerks and order fillers, dispatchers and customer service representatives. Individuals employed in production (manufacturing) occupations and construction and extraction occupations follow, with employment shares of 21.0 percent and 17.6 percent respectively. Transportation and material moving occupations account for nearly ten percent of industry employment and architecture and engineering occupations at 7.4 percent, round out the top five.

The wages of occupations in the oil and gas industry vary widely. Exhibit 3-3 shows average annual wages in the oil and gas industry in California for the different major occupational groups shown in Exhibit 3-2.

Exhibit 3-3**Average Wages by Major Occupational Group**
California Industry in 2015
(Excluding gas station industry)

Source: OES

A wide variety of detailed occupations exist in each major occupational group. The top 20 detailed occupations by employment share in the oil and gas industry in California and their associated wages in 2015 are shown in Exhibit 3-4, followed by the top 20 by average annual wages in Exhibit 3-5.

The top twenty detailed occupations account for just over half of the industry's workforce. In contrast, the top twenty highest paid occupations account for approximately twelve percent of the workforce. ❖

Exhibit 3-4**Detailed Industry Occupations by Employment Share (Excluding Gas Station Industry)

Gas Station Industry

Gasoline stations represent the retail side of the oil and gas industry, with products being sold to the end user.

The distribution of employment by major occupational group specific to gas stations in California is shown in Exhibit 3-6. The majority of individuals in this industry segment work in sales occupations, close to 80 percent. Most of these workers are cashiers. Workers in office and administrative occupations and transportation and material moving occupations rank second and third, each with employment shares of 7.2 percent and 4.7 percent respectively. The fourth largest group in terms of employment is food preparation and serving occupations, with just over four percent of workers.

The wages of these occupations also vary substantially. Exhibit 3-7 shows the average wages in the gas station industry in California for the different major occupational groups.

As expected, the highest average annual wages are paid to those in management occupations. Sales occupations, which account for more than 80 percent of gas station industry employment, earn on average \$22,490 per year. Overall, the industry average is \$25,070 annually. ❖

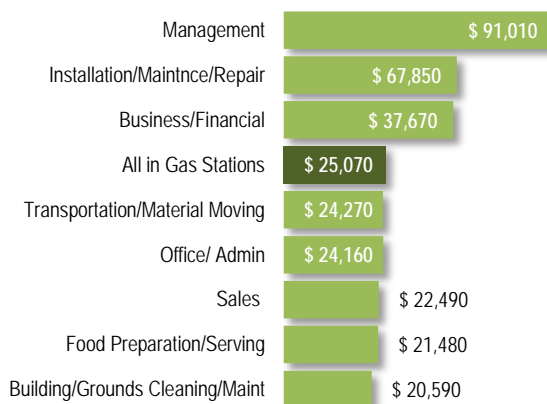

Exhibit 3-7
Average Annual Wages of Gas Station Industry
California 2015

Characteristics of the Industry Workforce

The composition of the workforce in the oil and gas industry varies according to sex, age, race and ethnicity and educational attainment.

Sex of Workforce

Workers in the oil and gas industry are predominantly male. In 2015, males represented 68 percent of the workforce (Exhibit 3-8).

Age of Workforce

The majority of the workforce is in its prime working age—between 22 years and 54 years of age, with almost half being in the 35 to 54 years of age group (Exhibit 3-9). Still, workers aged 55 years and older accounted for 24.5 percent, a significant share of the industry workforce.

Race and Ethnicity in the Workforce

The workforce in the oil and gas industry is diverse in both race and ethnicity (Exhibit 3-10). Workers reporting their race as white accounted for just over half of the workforce, with those reporting their ethnicity as Hispanic or Latino (all races) accounting for about 30 percent. Thirteen percent of industry workers reported as Asian and 5.3 percent identified as Black.

Educational Attainment of Workers

The industry provides a wide range of jobs to individuals with different levels of education (Exhibit 3-11). Approximately 39 percent of the workforce has a high school education or less; 22 percent have a high school diploma and 17.2 percent have less than a high school education. Oil and gas workers with some college education accounted for 28 percent of the workforce, and 23 percent have earned a bachelor's degree or higher. While more than a third of the workforce has an educational attainment of high school or less, these jobs in oil and gas industries are associated with higher earnings compared to those with the same levels of education across all industries in the state (Exhibit 3-12). ❖

4 Economic Contribution of Oil and Gas in California

Extraction, production, refining and petroleum products manufacturing result in highly tradable products both consumed domestically and exported, producing high revenues, high wage jobs and significant fiscal revenues for all levels of government.

Direct Economic Activity

Direct activity associated with the oil and gas industry is the direct contribution to the economy of the industry in terms of employment, labor income and value added.

Direct employment of the oil and gas industry includes all individuals whose employment is directly related to business establishments with activities that fall within the NAICS codes included in the industry definition. Measured on a job-count basis regardless of the number of hours worked, it includes full-time, part-time, permanent and seasonal employees and the self-employed.

Exhibit 4-1 displays the estimated direct employment associated with each component industry in the oil and gas industry in California in 2015.

The oil and gas industry in California provided 142,780 jobs in 2015, including independent contractors and payroll employees. Just over 30 percent was in oil and gas extraction, about a quarter in gas distribution and about seven percent each in oil and gas pipeline construction and petroleum refineries.

Exhibit 4-2 shows the distribution of estimated direct oil and gas industry employment by sub-region in 2015.

While the number of wells, and both gas and oil production levels are highest in the Central Valley/Northern California region, almost half of all industry employment is in Southern California.

Exhibit 4-1
Oil and Gas Industry Employment
California 2015

NAICS	Industry	Direct Employment
211	Oil and gas extraction	43,490

Exhibit 4-2
Oil and Gas Direct Employment
By Sub-Region 2015

Sources: Estimates by LAEDC

Labor income in the oil and gas industry is the value of all earnings received by both payroll employees and the self-employed, including benefits such as health insurance and pension plan contributions. Total labor payments by industry are presented in Exhibit 4-3.

Exhibit 4-3**Oil and Gas Industry Labor Income
California 2015**

NAICS	Industry	Labor Income (\$ millions)
211	Oil and gas extraction	\$ 4,758
213111	Drilling oil and gas wells	779
213112	Support activities for oil and gas operations	797

Oil and Gas Industry Labor Income		\$ 19,910
<i>Percent of California Total Labor Income</i>		<i>1.3%</i>

Note: Includes non-employers and independent contractors

Source: Estimates by LAEDC

More than 30 percent of the labor income in the industry was earned by natural gas distribution workers, nearly a quarter by oil and gas extraction workers and just under fourteen percent by workers at refineries. The total labor income paid by the oil and gas industry accounted for 1.3 percent of all labor income in California. ❖

Total Economic Contribution

The total economic contribution of the oil and gas industry in California includes indirect and induced activity in addition to the direct activity already identified. These direct, indirect and induced effects combined result in a considerable contribution to the California economy, which is presented in Exhibit 4-4.

It is estimated that the activities related to the oil and gas industry in California in 2015 generated value added equaling \$65.8 billion in California, approximately 2.7 percent of the state's GDP of \$2.5 trillion. The industry contributed 368,100 jobs, or 1.6 percent of the state total, with labor income of just over \$33 billion,

exceeding two percent of all labor income earned in the state.

Industry Distribution

The total economic contribution is achieved through activity occurring across a wide range of industry sectors via indirect and induced effects. The distribution of the total employment, labor income and value added contribution among industry sectors is presented in Exhibit 4-5.

Of the 368,100 jobs supported, close to 17 percent were in the mining sector (which includes much of the oil and gas industry) and approximately 10 percent were in the utilities sector (which includes natural gas distribution and electric power generation and transmission). However, virtually all industry sectors receive a positive economic impact from the oil and gas industry, including retail trade, health and social services, professional,

scientific and technical services, and accommodation and food services.

Exhibit 4-5

Total Economic Contribution of Oil and Gas Industry By Sector California 2015

	Jobs	Labor Income (\$ millions)	Value Added (\$ millions)
Ag, forestry, fish & hunting	1,010	\$67	\$83
Mining	61,030	6,342	9,791

Total	368,100	\$33,123	\$65,784

Source: Estimates by LAEDC

A description of the industry sectors is provided in the Appendix. ❖

Public Revenues

The oil and gas industry faces a high tax burden, incurred by both businesses operating within the industry and by consumers. The production, refining, distribution, retail and consumption of oil and gas all face taxes levied by local, state and federal governments.

Ad Valorem:

In California, ad valorem taxes are locally assessed and administered by each county. The state of California dictates that ad valorem taxes have a one percent maximum; however, individual counties have the option to add to this rate to satisfy local voter-approved debt. In the case of oil and gas industry, the market value of the mineral property interest is assessed by estimating the market value of proved reserves volumes.

Production:

While other states levy a severance tax on oil production, the state of California does not. Instead, the state imposes an assessment on oil and gas production in order to support the Department of Conservation's Division of Oil, Gas, and Geothermal Resources (DOGGR).

State and Local Excise Taxes:

Excise taxes are levied on the purchase of certain goods and are paid by the end user at the time of sale. California imposes an excise tax on both natural gas and oil sales. The state excise tax levied on natural gas consumption in California varies among the different private utility gas distributors in the state and with the type of customer (residential, commercial, industrial, etc.), while excises taxes levied on the purchase of fuel varies by fuel type.

Federal Excise Tax:

The federal government levies an excise tax on fuel consumption in addition to those levied by the State of California. The federal excise tax applied to the purchase of fuel (from point of sale, terminal, refinery or from outside of the U.S.) also varies by fuel type, including gasoline, aviation gasoline, diesel and jet fuel. Compressed natural gas used as a fuel for motor vehicles is also subject to a federal excise tax.

Sales Tax:

Sales tax is levied on the sale of gasoline by both state and local governments; the purchaser incurs the tax burden at the point of sale. State and local (county and city) sales tax rates are usually bundled together. The total rate varies from county to county (and even different areas within the same county), based upon voter approved measures specific to that geography. Diesel fuel sales in California are subject to an additional sales tax levied by the state.

Lease and Royalty Payments:

Oil and gas operations involved in extraction may enter into a mineral lease with the federal government to obtain the right to explore, drill, extract, remove, and dispose of oil and gas deposits on federally owned lands. Leases are purchased, bonus lease payments are paid, rental rates apply and once production is underway the lessees are subject to royalty fees.

The State Lands Commission's Mineral Resources Management Division is charged with the management and administration of oil and gas, geothermal and other mineral resources on state-owned public lands in California. In addition to initial bonus lease payments,

lease rent and royalties apply. They have 26 state tidelands oil and gas leases, only eight of which are not producing. Royalty payments on their leases are determined by several methods: price based sliding scale on oil royalty, sliding rate scale, net profits share and fixed royalty rates.

Private individuals also receive royalty payments for production activity taking place on their lands; as of 2015, there are an estimated 600,000 oil and gas royalty earning landowners in the state of California.

Other State and Local Taxes and Fees:

Additional taxes and fees relevant to the oil and gas industry in California include the following:

International Fuel Tax Agreement (IFTA) tax rates in California on diesel fuel at the close of 2015 were \$0.4500 per gallon purchased, to be redistributed among jurisdictions according to miles travelled in each. Miles travelled are reported by the commercial carrier in quarterly reports.

The *Underground Storage Tank Fee* funds programs to replace underground petroleum storage tanks in California that have reached or exceeded their regulated age limit.

The *Oil Spill Response Fee* applies to crude oil and petroleum products received at marine terminals, moving through marine pipelines, or received at California refineries. The fee has not been applicable since the fund reached its \$50 million maximum in 1991. However, in the event that this fund is accessed, it would once again apply. ❖

Total Fiscal Contribution

Given this background, the economic activity associated with the oil and gas industry in California in 2015 is estimated to have generated \$26.4 billion in state and local taxes and just under \$16 billion in federal tax revenues. The disaggregation of taxes by type is shown in Exhibit 4-6.

Of state and local government revenues, over \$21 billion was earned from sales and excise taxes (including those paid on the consumption of oil and gas products), \$2.6 billion was earned from property taxes paid by households and businesses and about \$1.4 billion was earned from personal and corporate income taxes.

Of federal taxes, \$7.2 billion in taxes was earned in excise taxes, \$3.0 billion from personal income taxes, \$2.0 billion in taxes on corporate profits and \$3.2 billion in social insurance payments. ❖

Economic Contribution by Industry

The total economic impact of the oil and gas industry in California in 2015 was just presented; however, each component industry is associated with its own distinct set of activities. These direct activities ripple through the California economy with different magnitudes.

Exhibit 4-7 identifies the total economic contribution (direct, indirect and induced) of each industry included in the definition of the larger oil and gas industry. The three component industries with the largest impacts are consistent across all four measures (employment, labor income, value added and output), these industries are natural gas distribution, oil and gas extraction and petroleum refineries.

Exhibit 4-8 shows the distribution of the total economic impact of each component industry, allowing for the comparison of each industry's share of the larger oil and gas industry's total economic contribution.

Exhibit 4-7**Total Economic Contribution by Industry in California 2015****Total Employment Impact (jobs):**

Source: Estimates by LAEDC

Exhibit 4-8**Total Economic Contribution by Industry California 2015**

In terms of employment and associated labor income, upstream activity (extraction) contributes a larger share compared to downstream activity (refineries), ranking second with twenty percent of each. When it comes to total value added and total output, refineries contribute a larger share, accounting for 32 percent and 43 percent respectively. ❖

5 Economic Contribution by Sub-Region and County

The oil and gas industry is widespread across the state. However, concentrations of activity are evident.

In this section, the industry is analyzed in four sub-regional geographies depicted in Exhibit 5-2: Southern California, the Central Coast, the San Francisco Bay Area, and Central Valley/ Northern California.

These four sub-regions account for 35 counties and more than ninety percent of the direct employment in the industry. The remaining counties are summarized in a Rest of State sub-region.

According to the Division of Oil, Gas and Geothermal Resources of the California Department of Conservation (DOGGR), well activity is similarly distributed among the sub-regions.

Active wells are distributed across the state, but the majority of them are located in Kern County in the Central Valley/ Northern California sub-region, as shown in Exhibit 5-1.

Exhibit 5-1
Active Wells in CA by County 2015

Direct activity and economic and fiscal contributions of each sub-region are presented in the following pages. ❖

California's Oil and Gas Industry by County

California is comprised of 58 individual counties. Oil and gas industry activity varies from county to county. This section identifies the direct activity of the oil and gas industry in each county and then estimates their economic and fiscal contribution.

Exhibit 5-18 identifies the direct industry employment, the total economic contribution and the total fiscal contribution of each county. Counties asterisked (*) are detailed in Section 8, in alphabetical order. ❖

Source: Estimates by LAEDC

Fiscal contributions may not sum to the aggregate state level fiscal contribution since some tax revenues cannot be estimated at the county level with any accuracy. The estimates provided at the county level are therefore likely to be conservative.

Additionally, county-level economic contributions may not add to sub-regional contributions because estimates are produced at defined geographic levels, which do not account for spill-over impacts between counties. Such spill-over effects are captured in state level impacts and in the sub-regional impacts. ❖

6 Refineries in California

This section focuses on refined petroleum products and byproducts, specifically describing what is produced through refining. Refined petroleum products include gasoline and diesel, liquefied petroleum gas (LPG), kerosene, jet fuel and fuel oils. Petrochemicals, byproducts of the refining process and generally also produced at refineries, are used as a feedstock for a wide range of materials including adhesives, detergents, solvents, and fibers, gels, lubricants, plastics and resins.

Additionally, both refined petroleum and petrochemicals are used as an input for a wide variety of consumer products including plastics, cosmetics, pharmaceuticals, wax-based products like packaging or crayons, paints, solvents, asphalt, pesticides and fertilizers (see Exhibit 6-1 for a partial list of products).

Exhibit 6-1

Petroleum-Based Consumer Products

Medical and Personal

antihistamines	inhalers	makeup
anesthetics	band aids	perfume
aspirin	latex gloves	contact lenses
cough syrup	syringes	lotion
vitamins	artificial limbs	diapers

Fuel and Lubricant

nylon, rayon	shoes	vinyl
	upholstery	styrofoam

Other Products

PVC pipe	electronics	toys
shingles	plastic containers	helmets
tires	plastic bags	guitar strings
asphalt/ tar	sponges	sports equipment

Compiled by LAEDC

The extent of purchases of refinery products made by other industries illustrates the broad reach that these products have throughout its user industries (see Exhibit 6-2). The top twenty industries purchased more than \$22.6 billion worth of products from California's refineries in 2015.

Both end-user consumers and user chain industries will be vulnerable to reductions of the supply of petroleum-based products. Response strategies may include: relocation; input substitution; operational shut-down; price increases; and more. Each of these options will have its own impact on the state's economic activity. The overall potential impact is demonstrated in the sections that follow. ❖

Backward Linkages

In his seminal work, *The Strategy of Economic Development* (1958), Albert O. Hirschman introduces the concept of backward and forward linkages to industries.

Backward linkages are the industries in the supply chain of a given industry, providing the inputs needed for its output. These are estimated for the refinery industry here using economic contribution analysis. Economic contribution quantifies the portion of a region's economy that can be attributed to an existing industry by tracing its purchases of goods and services in its supply chain, its payment of labor income to regional workers, and the tax revenues generated on its operations and their multiplier impacts. This analysis models what would happen if the industry did not exist in terms of those whose economic activity depends on supplying the industry. A detailed description of our methodology can be found in the Appendix. ❖

Backward linkages and forward linkages

Direct Activity and its Contribution

Direct activity associated with the refinery industry is its direct contribution to the economy in terms of employment, labor income and value added. Direct employment includes all individuals whose employment is directly related to refineries. Measured on a job-count basis regardless of the number of hours worked, it includes full-time, part-time, permanent and seasonal employees, contingent workers and the self-employed. Labor income includes all payments these employees receive, such as wages and benefits, and payroll taxes paid on their behalf.

Exhibit 6-3 displays the estimated direct activity associated with the refinery and petrochemical industry in California in 2015, the latest year for which complete data is available.

Total direct labor payments, the value of all earnings received by both payroll employees and the self-employed, including benefits such as health insurance and pension plan contributions, was an estimated \$2.9 billion in 2015, representing 0.2 percent of total labor income in the state.

In 2015, the industry in California provided 10,610 jobs. Direct employment in the industry accounted for just under one percent of employment in California.

Exhibit 6-3

Petroleum Refineries and Petrochemical Products Manufacturing California 2015

		% of CA Total
Employment (jobs):	10,610	0.1%
Labor income (\$ billions):	\$ 2.9	0.2%
Value added (\$ billions):	\$ 17.1	0.7%
Output (\$ billions):	\$ 57.4	1.4%

Source: Estimates by LAEDC

In addition to its own direct activity, petroleum refineries and petrochemical products manufacturing establishments generate significant spillover employment and labor income effects that are proportionately among the highest of all industries, consistent with the larger encompassing oil and gas industry. This is a consequence of the productivity of the industry and the high wages paid to industry workers.

The total economic contribution of the industry in California is presented in Exhibit 6-4.

Exhibit 6-4**Total Economic Contribution in California 2015

Indirect and Induced	18,740		
TOTAL		\$76,110	
<i>Percent of California Total Output</i>		<i>1.9%</i>	

Source: Estimates by LAEDC

It is estimated that the activities related to the refining and petrochemicals industry in California in 2015 supported 107,270 jobs with labor income of just over \$10.4 billion in 2015, and generated close to \$29.0 billion in value added (approximately 1.2 percent of the state's GDP of \$2.5 trillion) on output of \$76.1 billion.

Industry Distribution

The total economic contribution is achieved through activity occurring across a wide range of industry sectors via indirect and induced effects. The distribution of the total employment, labor income and output among industry sectors is presented in Exhibit 6-5.

Of the 107,270 jobs supported, just under 26 percent were in the mining sector (which includes much of the oil and gas industry) and approximately twelve percent in the manufacturing sector. However, virtually all industry sectors receive a positive economic impact from activity occurring in petroleum refineries and petrochemical products manufacturing industries,

including, health and social services, retail and wholesale trade, transportation and warehousing and accommodation and food services.

Source: Estimates by LAEDC

Output of an industry is its gross revenues. Looking at the disaggregation of the total effects of these two industries in terms of output across the different industries, illustrates the varying magnitudes of impact experienced by each industry sector stemming from activity taking place in petroleum refineries and petrochemical products manufacturing. By far, a disproportionately large impact occurs in the manufacturing sector (exactly 60 percent of the total impact in terms of output), followed by mining (just over sixteen percent), real estate and rental industries (just under four percent), wholesale trade (approximately three percent) and transportation and warehousing (close to three percent). Together, total output effects in these five industry sectors are valued at \$24.9 billion, exactly 86 percent of total generated output.

A description of the industry sectors is provided in the Appendix. ❖

Identifying Forward Linkages

Hirschman also introduces the concept of forward linkages to industries. *Forward linkages* are those industries that use the output of a given industry in their own production. For example, air transportation uses petroleum products in order to provide its services. The air transportation industry is a user of refinery products and is thus a forward linkage of the refinery industry. In this report, we refer to these first tier user industries as *primary users*.

For those industries that are not particularly vulnerable to refinery products in their supply chain, they may instead be dependent on the output of the primary industries. We refer to these industries as *secondary users*. Although they may not be directly impacted by disruption in availability and price of refinery products, they may well be already affected by the availability and price of the output of primary user industries.

This network of linkages is depicted in the diagram. Refinery products are used as inputs into production of primary industries A, B and C. The dependence of these primary industries is estimated using information about their business model and the market for their goods and services. These are direct forward linkages of the refinery and petrochemical industry. The output of these primary industries is used as inputs in the production of secondary industries D, E, F and G. While these are also forward linkages of the refinery and petrochemical industry, their vulnerability to supply disruptions is felt through their supplying primary industry.

We look at a variety of measures that identify these two tiers of forward linkages of the refinery and petrochemical industry in California. ❖

Constructing a Vulnerability Index

Primary users would be immediately impacted by reductions in the availability or increase in the price of refinery products if they were particularly dependent on them. To measure this dependence, we construct an index of vulnerability.

Hirschman's metric for quantifying a forward link was the share of an industry's output that is allocated to an intermediate input. Supplementing the original indicator suggested by Hirschman, we use three metrics to construct a composite index of vulnerability to input disruptions: (1) intensity of use; (2) trade exposure; and (3) gross operating surplus.

Intensity of Use

Refined petroleum products and petrochemical byproducts as an input of production are traced through the industry user chain to measure each user industry's *intensity of use* compared to its revenues (gross output). This is a measure of how dependent the user industry is on refinery products. Understanding interactions between producers of refined petroleum and petrochemical products across the different industries that use these products as an intermediate good in their own production, is valuable for understanding how these user industries stand to be affected by changes in the price and supply of these goods.

User industries with larger shares of these products as inputs to total industry revenues (gross output) have a larger dependency on them as an input in their production. As such, changes in the supply of these inputs will affect them disproportionately more compared to industries whose usage is a smaller share of their gross output.

Exhibit 6-6 lists the top industries that use refined petroleum and petrochemical products in their production in California, with dependency ranked by the share of input value to gross output in 2015.

Exhibit 6-6**Top 20 Industries by Refinery Products Inputs
As a Share of Gross Output**

NAICS	Industry	Share of Output (%)
324	Petroleum and Coal Products Manufacturing	19.2%
481	Air Transportation	15.1

Source: IMPLAN Data for California; Analysis by LAEDC

Several industries are combined because they are individually very small but are also quite vulnerable. These include agricultural industries, forestry and hunting, and mining and mining support.

Many of the industries (six of the top ten) with the largest intensity of use measure are in the transportation and warehousing sector: air, rail, water, truck and passenger ground transportation industries and the industry subsector of couriers and messengers. Industries within these subsectors rely heavily on transportation fuels (jet fuel, diesel, gasoline, etc.), which are requisite to the provision of their services.

Both petroleum and coal products manufacturing and chemical manufacturing often use refined petroleum and petrochemicals to produce other end products (petroleum refineries and petrochemical product manufacturing industries have first been backed out from their larger corresponding subsectors so as not to double count, and thereby overstate subsector usage).

Equipment used in forestry, hunting and fishing industries, such as timber harvesters, bunchers and

skidders, power generators and ocean vessels require fuel for operation as well.

Materials used in the construction industry, such as asphalt, roofing materials and PVC piping, are produced using refined petroleum and petrochemical products. Additionally, fossil fuels are used to operate heavy machinery including water trucks, bulldozers, excavators, loaders and graders.

Linkages of user industries of refined petroleum and petrochemical products are next evaluated in regards to trade sensitivity.

The full list of refinery product inputs as a share of output for all industries is provided in the Appendix.

Trade Sensitivity

Trade sensitivity or trade exposure provides an indication of an industry's ability to pass potentially higher costs of inputs through to its customers. Commodities traded in the global market must operate within the limitations presented by trade exposure. For example, if production costs increase for firms in California and necessitate price increases, in-state producers will face competition from producers in other states or nations and be unable to protect their market share.

For the composite vulnerability index, *trade sensitivity* is measured by the sum of an industry's domestic and foreign exports as a percentage of its total output. Exhibit 6-7 identifies the top twenty industries in California by their trade sensitivity in 2015.

Industries that export the majority of their output outside the state of California and therefore depend on larger markets for their sales revenue will be particularly vulnerable to changes in input prices. Their ability to increase prices to recover cost increases will be limited given the international competition they face.

California's manufacturing industries are particularly vulnerable to trade exposure. Six of the top ten industries with the highest trade intensities are manufacturing industries, including machinery, apparel and transportation equipment.

Exhibit 6-7**Top 20 Industries by Trade Exposure**

NAICS	Industry	Exposure (%)
316	Leather and Allied Product Manufacturing	96.1%
315	Apparel Manufacturing	77.0
721	Accommodation	76.5
333	Machinery Manufacturing	76.1
313	Textile Mills	73.7

The list of trade sensitivities for all industries is provided in the Appendix.

Gross Operating Surplus

As an alternative to raising prices of their goods and services, firms in industries that experience increased input costs may instead absorb cost increases through reduction in profits. This capability is necessarily dependent on an industry's typical profit experience. Many industries have extremely thin profit margins and will not be able to absorb costs increases without price increases—which, if they are exposed to trade, may also not be a viable option. Other industries have a significant margin cushion and are less vulnerable to increases in input prices.

Exhibit 5-8 ranks industries by their gross operating surplus as a percentage of total output (essentially, profit margins). The higher this margin, the more likely the user industry will be able to absorb higher input costs. Industries with smaller or even negative gross surplus as a share of total output have no capability to absorb cost increases. If they are also unable to increase

the prices of their goods and services, they will face an existential risk.

Industries in California, on average, operate close to the margin, with a gross operating surplus of 18.0 percent of total output. Industries that are especially significant and operating at a break-even point include construction, hospitals, repair and maintenance, and pipeline transportation. Still, the exhibit lists many industries that experience very small profit margins. These leave very little room for firms to absorb cost increases.

Exhibit 6-8**Top 20 Industries by Smallest Gross Operating Surplus**

NAICS	Industry	Gross Operating Surplus (As % Total Output)
443	Electronics and Appliance Stores	-33.9%
812	Personal and Laundry Services	-24.0

The list of gross operating surplus as a share of total output for all industries is provided in the Appendix.

Composite Index of Vulnerability

The three indicators (intensity of use, trade sensitivity and gross operating surplus) are used to construct an overall composite *vulnerability index*.

As the individual indicators that contribute to this index may be more or less important in determining

vulnerability to supply disruptions in the refinery industry, their values are weighted accordingly.

The share of output that must be allocated to the given input product is clearly the most important factor in judging vulnerability. An industry that does not use much petroleum products, for example, is not vulnerable to disruptions in its availability or price. This component is given a 55 percent weight in the composite vulnerability index.

Trade sensitivity is also relatively important as the ability for firms to compete in the global marketplace will determine their viability. This factor is allocated a 30 percent weight in the vulnerability index.

Finally, the share of output captured by gross operating surplus (or profits) is important, but is given a smaller weight of 15 percent in the vulnerability index, reflective of the variability in the indicator across firms within

industries and the elasticity of this indicator with respect to revenues. ❖

Primary User Industries

Exhibit 6-9 lists the top 20 vulnerable industries ranked by their corresponding composite index scores, along with their direct economic activity in California. These industries are at immediate risk to disruptions in the availability and price of refinery products.

Together, the primary tier of vulnerable industries provide 1.7 million jobs (7.6 percent of all jobs in California) with labor income of \$100.7 billion, and account for \$207.0 billion (or 8.5 percent) of state GDP.

A listing of the vulnerability index for all industries is provided in the Appendix. ❖

7 Detailed Industry Sheets

The following pages provide detailed data for each vulnerable primary and secondary user industry.

Primary Industries

For each of the top twenty vulnerable primary industries, we provide an industry description as detailed in the North American Industry Classification System (NAICS) in its sourcebook, *North American Industry Classification System*, published by the U.S. Office of Management and Budget (2013).

We quantify the industry in terms of employment, labor income, industry output and its contribution to state GDP. These metrics are an indication of the activity that is at risk.

We outline the products that each industry produces and sells in California, and list the industries that purchase its products. This provides an indication of the breadth and width the primary industry through its own user chain. Finally, we list the vulnerable secondary industries to the primary industry according to their vulnerability index.

Industries are shown in the following sequence:

Primary Industries	Page
Chemical Manufacturing	34
Utilities	36
Water Transportation	38
Accommodation	40
Agriculture	42
Couriers and Messengers	44
Air Transportation	46
Rail Transportation	48
Mining and Support Activities	50
Forestry, Hunting and Fishing	52

Petroleum and Coal Products Mfg	60
Support Activities for Transportation	62
Textile Mills	64
Transit and Ground Passenger Transport	66
Amusements, Gambling and Recreation	68
Oil and Gas Extraction	70
Paper Manufacturing	72

Primary Industry:

CHEMICAL MANUFACTURING
(NAICS 325*)

**Vulnerability
Index:**

9.7

**Industry Description**

This subsector is based on the transformation of organic and inorganic raw materials by a chemical process and the formulation of products. This subsector distinguishes the production of basic chemicals that comprise the first industry group from the production of intermediate and end products produced by further processing of basic chemicals that make up the remaining industry groups.

** For the purposes of this report, this industry has been modified to remove Petrochemical Manufacturing (NAICS 32511) to avoid double-counting.*

What Is At Risk?

This industry provides almost 75,100 jobs in California with average annual wages and benefits of \$154,070.

75,050 jobs

\$ 11.6 billion
Labor Income

\$ 103.7 billion
Industry Output

\$ 45.2 billion
Contribution to GDP

What This Primary Industry Sells

The products and services that are sold by this industry in California are shown in Exhibit 7-1.

Which Industries Are Most Vulnerable to Disruptions?

Although large purchases from this industry may be important, a secondary user industry's vulnerability depends on the three component metrics of the composite vulnerability index: (1) total purchases of these products as a share of total output; (2) trade intensity; and (3) gross operating surplus as a share of output. Secondary industries with a vulnerability index of 7.0 or greater to this primary industry are shown in Exhibit 6-3.

Primary Industry:

WATER TRANSPORTATION
(NAICS 483)

Vulnerability Index: 9.1

**Industry Description**

Industries in this subsector provide water transportation of passengers and cargo using watercraft, such as ships, barges and boats. The subsector is organized into two groups: (1) one for deep sea, coastal and Great Lakes; and (2) one for inland water transportation. This split typically reflects the difference in equipment used.

Primary Industry:

ACCOMMODATION (NAICS 721)

Industry Description

Industries in the Accommodation subsector provide lodging or short-term accommodations for travelers, vacationers, and others. There is a wide range of establishments in these industries. Some provide lodging only; while others provide meals, laundry services, and recreational facilities, as well as lodging.

The subsector is organized into three groups: (1) traveler accommodation, (2) recreational accommodation, and (3) rooming and boarding houses. Traveler Accommodation includes establishments that primarily provide traditional types of lodging services, hotels, motels, and bed-and-breakfast inns. RV (Recreational Vehicle) Parks and Recreational Camps includes establishments that operate lodging facilities to accommodate outdoor enthusiasts, travel trailer campsites, recreational vehicle parks, and outdoor adventure retreats. Rooming and Boarding Houses includes establishments providing temporary or longer-term accommodations, that for the period of occupancy, may serve as a principal residence.

Which Industries Are Most Vulnerable to Disruptions in this Industry?

Although large purchases from this industry may be important, a secondary user industry's vulnerability depends on the three component metrics of the composite vulnerability index: (1) total purchases of these products as a share of total output; (2) trade intensity; and (3) gross operating surplus as a share of output. Secondary industries with a vulnerability index of 7.0 or greater to this primary industry are shown in Exhibit 7-12.

Primary Industry:

AGRICULTURE

(NAICS 111, 112, 115)

Vulnerability
Index:

8.7

Industry Description

Agriculture includes three subsectors (1) crop production, (2) animal production and aquaculture and (3) support activities for agriculture and forestry. Industries in the Crop Production subsector grow crops mainly for food and fiber.

Industries in the Animal Production and Aquaculture subsector raise or fatten animals for the sale of animals or animal products and/or raise aquatic plants and animals in controlled or selected aquatic environments for the sale of aquatic plants, animals, or their products.

Industries in the Support Activities for Agriculture and Forestry subsector provide support services that are an essential part of agricultural and forestry production which may be performed by the agriculture or forestry producing establishment or conducted independently as an alternative source of inputs required for the production process for a given crop, animal, or forestry industry.

What Is At Risk?

This industry provides more than 500,000 jobs in California with average annual wages and benefits of \$59,710.

Primary Industry:

COURIERS AND MESSENGERS (NAICS 492)

Industry Description

Industries in this subsector provide intercity, local, and/or international delivery of parcels and documents (including express delivery services) without operating under a universal service obligation. These articles may originate in the U.S. but be delivered to another country and can be described as those that may be handled by one person without using special equipment. This allows the collection, pick-up, and delivery operations to be done with limited labor costs and minimal equipment. Sorting and transportation activities, where necessary, are generally mechanized. The restriction to small parcels partly distinguishes these establishments from those in the transportation industries. The complete network of courier services establishments also distinguishes these transportation services from local messenger and delivery establishments in this subsector. This includes the establishments that perform intercity transportation as well as establishments that, under contract to them, perform local pick-up and delivery. Messengers, which usually deliver within a metropolitan or single urban area, may use bicycle, foot, small truck, or van.

Primary Industry:

AIR TRANSPORTATION (NAICS 481)

Industry Description

Industries in this subsector provide air transportation of passengers and/or cargo using aircraft, such as airplanes and helicopters. The subsector distinguishes scheduled from nonscheduled air transportation. Scheduled air carriers fly regular routes on regular schedules and operate even if flights are only partially loaded.

Nonscheduled carriers often operate during nonpeak time slots at busy airports. These establishments have more flexibility with respect to choice of airport, hours of operation, load factors, and similar operational characteristics. Nonscheduled carriers provide chartered air transportation of passengers, cargo, or specialty flying services.

Specialty flying services establishments use general-purpose aircraft to provide a variety of specialized flying services.

Primary Industry:

RAIL TRANSPORTATION
(NAICS 482)

**Vulnerability
Index:** 8.3

Industry Description

Industries in this subsector provide rail transportation of passengers and/or cargo using railroad rolling stock. The railroads in this subsector primarily either operate on networks, with physical facilities, labor force, and equipment spread over an extensive geographic area, or operate over a short distance on a local rail line.

What Is At Risk?

This industry provides almost 12,000 jobs in California with average annual wages and benefits of \$115,560.

Primary Industry:

MINING AND MINING SUPPORT (NAICS 212, 213)

Industry Description

Mining and mining support includes two subsectors, (1) Mining (except oil and gas) and (2) support activities for mining. Industries in the mining (except Oil and Gas) subsector primarily engage in mining, mine site development, and beneficiating (i.e., preparing) metallic minerals and nonmetallic minerals, including coal. It includes ore extraction, quarrying, and beneficiating (e.g., crushing, screening, washing, sizing, concentrating, and flotation), customarily done at the mine site. Industries in the Support Activities for Mining subsector group establishments primarily providing support services, on a contract or fee basis, required for the mining and quarrying of minerals and for the extraction of oil and gas. Establishments performing exploration (except geophysical surveying and mapping) for minerals, on a contract or fee basis, are included in this subsector. Exploration includes traditional prospecting methods, such as taking core samples and making geological observations at prospective sites.

Primary Industry:

FORESTRY, HUNTING AND FISHING (NAICS 113, 114)

Industry Description

Forestry, hunting and fishing include two subsectors (1) forestry and logging and (2) fishing, hunting and trapping. Industries in the forestry and logging subsector grow and harvest timber on a long production cycle (i.e., of 10 years or more). Long production cycles use different production processes than short production cycles, which require more horticultural interventions prior to harvest, resulting in processes more similar to those found in the crop production subsector.

Consequently, production involving production cycles of less than 10 years, are classified in the crop production subsector. Industries in the fishing, hunting and trapping subsector harvest fish and other wild animals from their natural habitats and are dependent upon a continued supply of the natural resource.

The harvesting of fish is the predominant economic activity of this subsector and it usually requires specialized vessels that, by the nature of their size, configuration and equipment, are not suitable for any other type of production, such as transportation.

**Industry Description**

Industries in this subsector create end products that apply mechanical force, for example, the application of gears and levers, to perform work. Some important processes for the manufacture of machinery are forging, stamping, bending, forming, and machining that are used to shape individual pieces of metal. Processes, such as welding and assembling are used to join separate parts together. Although these processes are similar to those used in metal fabricating establishments, machinery manufacturing is different because it typically employs multiple metal forming processes in manufacturing the various parts of the machine. Moreover, complex assembly operations are an inherent part of the production process.

What Is At Risk?

This industry provides over 78,100 jobs in California with average annual wages and benefits of \$98,110.

Which Industries Are Most Vulnerable to Disruptions in this Industry?

Although large purchases from this industry may be important, a secondary user industry's vulnerability depends on the three component metrics of the composite vulnerability index: (1) total purchases of these products as a share of total output; (2) trade intensity; and (3) gross operating surplus as a share of output. Secondary industries with a vulnerability index of 7.0 or greater to this primary industry are shown in Exhibit 7-33.

Primary Industry:

PRINTING AND RELATED SUPPORT ACTIVITIES (NAICS 323)

Vulnerability
Index:

7.7

Industry Description

Industries in this subsector print products, such as newspapers, books, labels, business cards, stationery, business forms, and other materials, and perform support activities, such as data imaging, platemaking services, and bookbinding. The support activities included here are an integral part of the printing industry, and a product (a printing plate, a bound book, or a computer disk or file) that is an integral part of the printing industry is almost always provided by these operations.

What Is At Risk?

This industry provides almost 58,200 jobs in California with average annual wages and benefits of \$47,180.

Primary Industry:**PLASTICS AND RUBBER PRODUCTS MANUFACTURING
(NAICS 326)****Vulnerability
Index:****7.6****Industry Description**

Industries in this subsector make goods by processing plastics materials and raw rubber. The core technology employed by establishments in this subsector is that of plastics or rubber product production. Plastics and rubber are combined in the same subsector because plastics are increasingly being used as a substitute for rubber; however the subsector is generally restricted to the production of products made of just one material, either solely plastics or rubber.

What Is At Risk?

This industry provides close to 47,000 jobs in California with average annual wages and benefits of \$60,730.

Primary Industry:

PETROLEUM AND COAL PRODUCTS MANUFACTURING (NAICS 324*)

Industry Description

The Petroleum and Coal Products Manufacturing subsector is based on the transformation of crude petroleum and coal into usable products. The dominant process is petroleum refining that involves the separation of crude petroleum into component products through such techniques as cracking and distillation.

In addition, this subsector includes establishments that primarily further process refined petroleum and coal products and produce products, such as asphalt coatings and petroleum lubricating oils. However, establishments that manufacture petrochemicals from refined petroleum are classified in Industry 32511, Petrochemical Manufacturing.

* For the purposes of this report, this industry has been modified to remove Petroleum Refineries (NAICS 32411) to avoid double-counting.

Primary Industry:

SUPPORT ACTIVITIES FOR TRANSPORTATION (NAICS 487, 488)

Industry Description

This primary industry is comprised of two subsectors: (1) scenic and sightseeing transportation; and (2) support activities for transportation—the latter being by far the largest contributor. Industries in Scenic and Sightseeing Transportation utilize transportation equipment to provide recreation and entertainment. These activities have a production process distinct from passenger transportation carried out for the purpose of other types of for-hire transportation. This process does not emphasize efficient transportation; in fact, such activities often use obsolete vehicles, such as steam trains, to provide some extra ambience.

Industries in the Support Activities for Transportation subsector provide services which support transportation. These services may be provided to transportation carrier establishments or to the general public. This subsector includes a wide array of establishments, including air traffic control services, marine cargo handling, and motor vehicle towing. The subsector is separated by type of mode serviced (air, rail, water and road). The subsector also includes freight transportation arrangement and packing and crating services.

Primary Industry:

TEXTILE MILLS
(NAICS 313)

Vulnerability
Index:

7.3

Industry Description

Industries in this subsector group establishments that transform a basic fiber (natural or synthetic) into a product, such as yarn or fabric that is further manufactured into usable items, such as apparel, sheets, towels, and textile bags for individual or industrial consumption. The further manufacturing may be performed in the same establishment and classified in this subsector, or it may be performed at a separate establishment and be classified elsewhere in manufacturing. The main processes in this subsector include preparation and spinning of fiber, knitting or weaving of fabric, and the finishing of the textile.

Primary Industry:**TRANSIT AND GROUND PASSENGER
TRANSPORTATION**

(NAICS 485)

**Vulnerability
Index:****7.1****Industry Description**

Industries in the Transit and Ground Passenger Transportation subsector include a variety of passenger transportation activities, such as urban transit systems; chartered bus, school bus, and interurban bus transportation; and taxis. These activities are distinguished based primarily on such production process factors as vehicle types, routes, and schedules.

In this subsector, the principal splits identify scheduled transportation as separate from nonscheduled transportation. The scheduled transportation industry groups are Urban Transit Systems, Interurban and Rural Bus Transportation, and School and Employee Bus Transportation. The nonscheduled industry groups are the Charter Bus Industry and Taxi and Limousine Service. The Other Transit and Ground Passenger Transportation industry group includes both scheduled and nonscheduled transportation.

Which Industries Are Most Vulnerable to Disruptions in this Industry?

Although large purchases from this industry may be important, a secondary user industry's vulnerability depends on the three component metrics of the composite vulnerability index: (1) total purchases of these products as a share of total output; (2) trade intensity; and (3) gross operating surplus as a share of output. Secondary industries with a vulnerability index of 7.0 or greater to this primary industry are shown in Exhibit 7-54.

Primary Industry:**OIL AND GAS EXTRACTION
(NAICS 211)****Vulnerability
Index:****7.0****Industry Description**

Industries in the Oil and Gas Extraction subsector operate and/or develop oil and gas field properties. Such activities may include exploration for crude petroleum and natural gas; drilling, completing, and equipping wells; operating separators, emulsion breakers, desilting equipment, and field gathering lines for crude petroleum and natural gas; and all other activities in the preparation of oil and gas up to the point of shipment from the producing property. This subsector includes the production of crude petroleum, the mining and extraction of oil from oil shale and oil sands, the production of natural gas, sulfur recovery from natural gas, and recovery of hydrocarbon liquids.

What Is At Risk?

This industry provides over 43,900 jobs in California with average annual wages and benefits of \$112,560.

43,920 jobs**\$ 4.9 billion**
Labor Income**\$ 10.8 billion**
Industry Output**\$ 7.7 billion**

Primary Industry:
PAPER MANUFACTURING
 (NAICS 322)

**Vulnerability
Index:**

7.0

Industry Description

Industries in this subsector make pulp, paper, or converted paper products. The manufacturing of these products is grouped together because they constitute a series of vertically connected processes. More than one is often carried out in a single establishment. There are essentially three activities. The manufacturing of pulp involves separating the cellulose fibers from other impurities in wood or used paper. The manufacturing of paper involves matting these fibers into a sheet. Converted paper products are made from paper and other materials by various cutting and shaping techniques and includes coating and laminating activities.

What Is At Risk?

This industry provides more than 21,200 jobs in California with average annual wages and benefits of \$89,130.

8 Geography of the Jobs at Risk

Changes that occur in the direct activity associated with production and the refinery industry will not only affect employment in the industries themselves, but will also have a ripple affect across user industries that rely upon the use of refined products in their supply chain, or who are users of the dependent industry's output. Individuals whose employment are in these industries have jobs at risk.

Crude oil is the primary input for production in petroleum refineries. In California, the refinery industry (petroleum refineries and petrochemical products manufacturing) directly employs 10,220 and industry sectors identified to be the most at risk due to their interconnectedness with the refining industry (manufacturing, transportation and agriculture), provide 2.2 million jobs statewide (Exhibit 8-1).

Exhibit 8-1

Jobs At Risk Due to Industry Interconnectedness California 2015

	Payroll Jobs	Ave Annual Wage in CA
Agriculture	421,213	\$ 30,280
Manufacturing	1,284,296	83,870
Transportation and Warehousing	478,309	51,580
Total Jobs in At-Risk Sectors	2,183,818	\$ 66,460
<i>Share of Total Jobs</i>	<i>13.4%</i>	
Total Covered	16,295,204	\$ 61,700

Source: Estimates by LAEDC

These jobs are dispersed across different geo-political boundaries in the state, with each area boasting unique mixes and concentrations of the respective industries. This section identifies both (mix and concentrations) for industries most at risk across the different counties and across different congressional districts located in California.

County Level

California is comprised of 58 counties, each with a distinctive mix of industries. Counties in the state vary significantly in land area, population size, total employment, demographics, industry mix and more.

Employment and wage data is available at the county level from the California Employment Development Department (EDD) Labor Market Information Division, Quarterly Census of Employment & Wages (QCEW). Data

is obtained from the Unemployment Insurance program and represents approximately 99.7 percent of all private payroll employment in the nation (excluding the self-employed). The most current annual data available is for 2015. These are job counts, and may be full- or part-time.

Congressional Districts

The United States and its House of Representatives is split into 435 congressional districts according to population size, with approximately 710,000 residents in each district. California, the most populous state, has 53 congressional districts accounting for just over twelve percent of districts nationwide.

Employment data at the industry sector level by congressional district in California is available through the U.S. Census Bureau, the most recent available is for 2014.

Oil and Gas Industries

NAICS 211: Oil and gas extraction

Establishments within this industry subsector operate and/or develop oil and gas field properties, either on their own account or for others on a contract or fee basis. Activities include: exploration for crude petroleum and natural gas; drilling, completing, and equipping wells; operating separators, emulsion breakers, desilting equipment, and field gathering lines for crude petroleum and natural gas; and all other activities in the preparation of oil and gas up to the point of shipment from the producing property. This subsector includes the production of crude petroleum, the mining and extraction of oil from oil shale and oil sands, and the production of natural gas, sulfur recovery from natural gas, and recovery of hydrocarbon liquids.

NAICS 213111: Drilling oil and gas wells

Establishments in this U.S. industry are primarily engaged in drilling oil and gas wells for others on a contract or fee basis. This industry includes contractors that specialize in spudding in, drilling in, redrilling, and directional drilling.

NAICS 213112: Support activities for oil and gas operations

Establishments in this U.S. industry are primarily engaged in performing support activities on a contract or fee basis for oil and gas operations (except site preparation and related construction activities). Services included are exploration (except geophysical surveying and mapping); excavating slush pits and cellars, well surveying; running, cutting, and pulling casings, tubes, and rods; cementing wells, shooting wells; perforating well casings; acidizing and chemically treating wells; and cleaning out, bailing, and swabbing wells.

NAICS 2212: Natural gas distribution

Establishments in this industry are: primarily engaged in: operating gas distribution systems (e.g., mains, meters); known as gas marketers that buy gas from the well and sell it to a distribution system; known as gas brokers or agents that arrange the sale of gas over gas distribution systems operated by others; and those primarily engaged in transmitting and distributing gas to final consumers. Only privately owned establishments are included in this report.

NAICS 23712: Oil and gas pipeline and related structures construction

Establishments in this industry include those primarily engaged in the construction of oil and gas lines, mains, refineries, and storage tanks. The work performed may include new work, reconstruction, rehabilitation, and repairs. Specialty trade contractors are included if they are engaged in activities primarily related to oil and gas pipeline and related structures construction. All structures (including buildings) that are integral parts of oil and gas networks (e.g., storage tanks, pumping stations, and refineries) are included in this industry.

NAICS 32411: Petroleum refineries

Establishments in this industry are primarily engaged in refining crude petroleum into refined petroleum. Petroleum refining involves one or more of the following activities: (1) fractionation; (2) straight distillation of crude oil; and (3) cracking.

NAICS 324191: Petroleum lubricating oil and grease manufacturing

Establishments in this U.S. industry are primarily engaged in blending or compounding refined petroleum to make lubricating oils and greases and/or re-refining used petroleum lubricating oils.

NAICS 32511: Petrochemical manufacturing

Establishments in this industry are primarily engaged in manufacturing acyclic (i.e., aliphatic) hydrocarbons such as ethylene, propylene, and butylene made from refined petroleum or liquid hydrocarbons and/or manufacturing cyclic aromatic hydrocarbons such as benzene, toluene, styrene, xylene, ethyl benzene, and cumene made from refined petroleum or liquid hydrocarbons.

NAICS 333132: Oil and gas field machinery and equipment manufacturing

This U.S. industry is comprised of establishments primarily engaged in (1) manufacturing oil and gas field machinery and equipment, such as oil and gas field drilling machinery and equipment; oil and gas field production machinery and equipment; and oil and gas field derricks and (2) manufacturing water well drilling machinery.

NAICS 4247: Petroleum and petroleum products merchant wholesalers

Establishments in this industry group are primarily engaged in the Petroleum Bulk Stations and Terminals industry, with bulk liquid storage facilities primarily engaged in the merchant wholesale distribution of

crude, petroleum and petroleum products, including liquefied petroleum gas, or the Petroleum and Petroleum Products Merchant Wholesalers industry, the merchant wholesale distribution of petroleum and petroleum products (except from bulk liquid storage facilities).

NAICS 447: Gasoline stations

Establishments in this subsector retail automotive fuels (e.g., gasoline, diesel fuel, gasohol, alternative fuels) and automotive oils or retail these products in combination with convenience store items. These establishments have specialized equipment for the storage and dispensing of automotive fuels.

NAICS 45431: Fuel dealers

Establishments in this industry are primarily engaged in retailing heating oil, liquefied petroleum (LP) gas, and other fuels via direct selling.

NAICS 486: Pipeline transportation

Industries in this subsector use transmission pipelines to transport products, such as crude oil, natural gas, refined petroleum products, and slurry. Industries are identified based on the products transported (i.e., pipeline transportation of crude oil, natural gas, refined petroleum products, and other products). The Pipeline Transportation of Natural Gas industry includes the storage of natural gas because the storage is usually done by the pipeline establishment and because a pipeline is inherently a network in which all the nodes are interdependent. ❖

Refinery and Petrochemical Industry

NAICS 32411: Petroleum refineries

Establishments in this industry are primarily engaged in refining crude petroleum into refined petroleum. Petroleum refining involves one or more of the following activities: (1) fractionation; (2) straight distillation of crude oil; and (3) cracking.

NAICS 32511: Petrochemical manufacturing

Establishments in this industry are primarily engaged in manufacturing acyclic (i.e., aliphatic) hydrocarbons such as ethylene, propylene, and butylenes made from refined petroleum or liquid hydrocarbons and/or manufacturing cyclic aromatic hydrocarbons such as benzene, toluene, styrene, xylene, ethyl benzene, and cumene made from refined petroleum or liquid hydrocarbons.

Methodology

Backward Linkages

Economic contribution analysis is used to describe that portion of a region's economy that can be attributed to an existing industry. Contribution analysis measures the value of the industry in terms of its *backward linkages*—its purchases of goods and services in its supply chain, its payment of labor income to regional workers, and the tax revenues generated on its operations and multiplier impacts. This analysis models what would happen if the industry did not exist in terms of those whose economic activity depends on supplying the industry.

The primary economic contribution to California's economy of the oil and gas industry is the expenditure of hundreds of millions of dollars towards goods and services from regional vendors. This injection of funds circulates from the initial recipients to the owners and employees of establishments that help supply the goods and services that the industry purchases.

The industry also spends billions of dollars every year for the wages and benefits of its employees and contract workers. These workers, as well as the employees of all the industry's suppliers, spend a portion of their incomes on groceries, rent, vehicle expenses, healthcare, entertainment, and so on. The recirculation of the original expenditures multiplies the initial spending through these indirect and induced effects.

The extent to which the initial expenditures multiply is estimated using economic models that depict the relationships between industries (such as oil production and its suppliers) and among different economic agents (such as industries and their employees).

These models are built upon actual data of expenditure patterns that are reported to the U.S. Bureau of Labor Statistics, the U.S. Census Bureau and the Bureau of Economic Analysis of the U.S. Department of Commerce. Data is regionalized so that it reflects and incorporates local conditions such as prevailing wages rates, expenditure patterns, and resource availability and costs.

The magnitude of the multiplying effect differs from one region to another depending on the extent to which the local region can fill the demand for all rounds of supplying needs. For example, the automobile manufacturing industry has high multipliers in Detroit and Indiana since these regions have deep and wide

supplier networks, while the same industry multiplier in Phoenix is quite small. In another example, the jobs multiplier for the construction industry is higher in, say, Arkansas, than in California because the same amount of spending will purchase fewer workers in Los Angeles than in Little Rock.

Multipliers can also differ from year to year as relative material and labor costs change and as the production “recipe” of industries change. For example, the IT revolution significantly reduced the job multiplier of many industries (such as manufacturing, accounting, architecture and publishing) as computers replaced administrative and production workers.

The metrics used to determine the value of the economic contribution are employment, labor income, value-added and the value of output. *Employment* includes full-time, part-time, permanent and seasonal employees and the self-employed, and is measured on a job-count basis regardless of the number of hours worked. *Labor income* includes all income received by both payroll employees and the self-employed, including wages and benefits such as health insurance and pension plan contributions. *Value-added* is the measure of the contribution to GDP made by the industry, and consists of compensation of employees, taxes on production and gross operating surplus. *Output* is the value of the goods and services produced. For most industries, this is simply the revenues generated through sales; for others, in particular retail industries, output is the value of the services supplied.

Estimates are developed using software and data from IMPLAN Group, LLC which traces inter-industry transactions resulting from an increase in demand in a given region. The economic region of interest is the state of California, and the activity is reported for 2015, the most recent year for which a complete set of data is available. Estimates for labor income, value added and output are expressed in 2015 dollars to maintain consistency with the reported industry activity.

The total estimated economic contribution includes *direct*, *indirect* and *induced* effects.

Direct activity includes the materials purchased and the employees hired by the industry itself. *Indirect effects* are those which stem from the employment and business revenues motivated by the purchases made by the industry and any of its suppliers. *Induced effects* are those generated by the spending of employees whose wages are sustained by both direct and indirect spending.

Contribution analysis differs from economic impact analysis in that linkages between the component industries as described below are removed so that indirect activity is not double-counted as also part of direct activity.

The correspondence between the identified NAICS and sectors used in IMPLAN are straightforward, with a few exceptions. Several IMPLAN sectors (32, 36, 319, and 331) include activities of NAICS unrelated to the oil and gas industry. Direct activity related to the oil and gas industry for these sectors was based on specific isolated employment estimates. ❖

Forward Linkages

Another prism through which the industry can be viewed is its *forward linkages*—the extent to which its products are incorporated into the manufacturing and service delivery operations of the rest of the economy. In the case of the refinery industry, for example, those industries which are highly dependent on transportation fuels, such as trucking, aviation and construction industries, and manufacturing industries dependent on petroleum byproducts in the production of their own products, such as plastics manufacturers and medical device manufacturers.

Understanding these linkages is important in evaluating how cost increases in oil and gas industry products might ripple through the manufacturing and service delivery chains.

In this report, refinery and petrochemical products are traced through the industry user chain and each *primary* user industry's *intensity of use* compared to its as a share of revenues, which represents a measure of the user industry's dependency on refined and petrochemical products. An industry that primarily depends on oil and gas inputs for production will be affected to a greater extent than other, less reliant industries.

This dependency is evaluated against the user industry's gross operating surplus, which points to the industry's ability to absorb higher costs of inputs.

Lastly, each user industry's *trade sensitivity* will be estimated to provide an indication of its ability to pass the higher costs of inputs through to its customers.

The combination of these measures provides the basis for a *vulnerability indicator*. The composite index is derived as discussed in the text.

For the top twenty user industries by vulnerability indicator, employment, labor income, output and direct contribution to GDP are estimated to provide orders of magnitude of the economic activity that is at immediate risk from disruption of supply of refined petroleum products and byproducts.

The metrics used to determine orders of magnitude for primary user industries are employment, labor income, value-added and the value of output as described above.

The data used to conduct this analysis is the Industry Economic Accounts produced by the Bureau of Economic Analysis of the Department of Commerce (specifically, the Make and Use tables) as estimated and aggregated by the IMPLAN Group, LLC in its latest software release for the 2015 calendar year. The economic region of interest is the state of California. Estimates for labor income and output are expressed in 2015 dollars to maintain consistency with the reported industry activity.

Workforce Characteristics Methodology

Data for worker characteristics according to industry is not available at the same detailed level as it is for employment. As such, some modifications were made to the industry definition in reporting workers characteristics. Specifically, the following industries from Exhibit 1-1 were excluded from the workforce analysis: 23712, 32511, 333132 and 45431.

The Center for Economic Studies at the U.S. Census Bureau provides several public-use data products derived from existing census, survey, and administrative data. One of these products is the Quarterly Workforce Indicators (QWI), which provides workforce statistics by

demography, geography and industry at the sector, subsector and 4-digit industry level.

The QWI is unique in that it reports data at the job-level, obtained from linked employer-employee microdata in the Longitudinal Employer-Household Dynamics (LEHD), a database covering more than 95 percent of U.S. private sector jobs. Additional sources include administrative records on employment by states, Social Security data, Federal tax records and other census and survey data.

Data available through the QWI allows for the analysis of the demographics of a particular labor market or specific industry, as is done in this report for the oil and gas industry. Estimates used to determine employment distributions of worker characteristics are stable full-quarter employment counts, the number of jobs held on both the first and last day of the quarter with the same employer. Quarterly data has been annualized. ❖

Description of NAICS Industry Sectors

The industry sectors used in this report are established by the North American Industry Classification System (NAICS). NAICS divides the economy into twenty sectors, and groups industries within these sectors according to production criteria. Listed below is a short description of each sector as taken from the sourcebook, *North American Industry Classification System*, published by the U.S. Office of Management and Budget (2012).

Agriculture, Forestry, Fishing and Hunting: Activities of this sector are growing crops, raising animals,

harvesting timber, and harvesting fish and other animals from farms, ranches, or the animals' natural habitats.

Mining: Activities of this sector are extracting naturally-occurring mineral solids, such as coal and ore; liquid minerals, such as crude petroleum; and gases, such as natural gas; and beneficiating (e.g., crushing, screening, washing and flotation) and other preparation at the mine site, or as part of mining activity.

Utilities: Activities of this sector are generating, transmitting, and/or distributing electricity, gas, steam,

and water and removing sewage through a permanent infrastructure of lines, mains, and pipes.

Construction: Activities of this sector are erecting buildings and other structures (including additions); heavy construction other than buildings; and alterations, reconstruction, installation, and maintenance and repairs.

Manufacturing: Activities of this sector are the mechanical, physical, or chemical transformation of material, substances, or components into new products.

Wholesale Trade: Activities of this sector are selling or arranging for the purchase or sale of goods for resale; capital or durable non-consumer goods; and raw and intermediate materials and supplies used in production, and providing services incidental to the sale of the merchandise.

Retail Trade: Activities of this sector are retailing merchandise generally in small quantities to the general public and providing services incidental to the sale of the merchandise.

Transportation and Warehousing: Activities of this sector are providing transportation of passengers and cargo, warehousing and storing goods, scenic and sightseeing transportation, and supporting these activities.

Information: Activities of this sector are distributing information and cultural products, providing the means to transmit or distribute these products as data or communications, and processing data.

Finance and Insurance: Activities of this sector involve the creation, liquidation, or change of ownership of financial assets (financial transactions) and/or facilitating financial transactions.

Real Estate and Rental and Leasing: Activities of this sector are renting, leasing, or otherwise allowing the use of tangible or intangible assets (except copyrighted works), and providing related services.

Professional, Scientific, and Technical Services: Activities of this sector are performing professional, scientific, and technical services for the operations of other organizations.

Management of Companies and Enterprises: Activities of this sector are the holding of securities of companies and enterprises, for the purpose of owning controlling interest or influencing their management decision, or

administering, overseeing, and managing other establishments of the same company or enterprise and normally undertaking the strategic or organizational planning and decision-making of the company or enterprise.

Administrative and Support and Waste Management and Remediation Services: Activities of this sector are performing routine support activities for the day-to-day operations of other organizations, such as: office administration, hiring and placing of personnel, document preparation and similar clerical services, solicitation, collection, security and surveillance services, cleaning, and waste disposal services.

Educational Services: Activities of this sector are providing instruction and training in a wide variety of subjects. Educational services are usually delivered by teachers or instructors that explain, tell, demonstrate, supervise, and direct learning. Instruction is imparted in diverse settings, such as educational institutions, the workplace, or the home through correspondence, television, or other means.

Health Care and Social Assistance: Activities of this sector are operating or providing health care and social assistance for individuals.

Arts, Entertainment and Recreation: Activities of this sector are operating facilities or providing services to meet varied cultural, entertainment, and recreational interests of their patrons, such as: (1) producing, promoting, or participating in live performances, events, or exhibits intended for public viewing; (2) preserving and exhibiting objects and sites of historical, cultural, or educational interest; and (3) operating facilities or providing services that enable patrons to participate in recreational activities or pursue amusement, hobby, and leisure-time interests.

Accommodation and Food Services: Activities of this sector are providing customers with lodging and/or preparing meals, snacks, and beverages for immediate consumption.

Other Services (except Public Administration): Activities of this sector are providing services not specifically provided for elsewhere in the classification system. Establishments in this sector are primarily engaged in activities, such as equipment and machinery repairing, promoting or administering religious activities, grant-making, advocacy, and providing dry-cleaning and laundry services, personal care services, death care services, pet care services, photofinishing services, temporary parking services, and dating services. ❖

Study Authors

Somjita Mitra, Ph.D.

Senior Economist, Institute for Applied Economics

Somjita Mitra manages the LAEDC Institute for Applied Economics. She is involved in planning, designing and conducting research and analysis for consulting clients and local businesses and governments, as well as for LAEDC's internal departments. Her focus is in regional analysis, economic impact studies and the industrial and occupational structure of local economies.

Before joining the LAEDC, Dr. Mitra was an Economist for a local economic research and litigation consulting company evaluating economic damages, estimating lost profits, identifying key economic issues and developing necessary analytical and empirical frameworks. Prior to this, Dr. Mitra was Project Director for a consumer research firm in Los Angeles where she managed projects that identified and analyzed key market issues for local firms as well as multinational corporations.

Dr. Mitra received her Bachelor of Arts in Economics and Political Science from the University of California, Los Angeles and her Master of Arts in Politics, Economics and Business as well as her Ph.D. in Economics from Claremont Graduate University. Dr. Mitra enjoys volunteering in the local community and is actively involved in both women's welfare and animal rescue organizations.

Shannon M. Sedgwick

Economist, Institute for Applied Economics

In her current capacity as an Economist at the LAEDC, Ms. Sedgwick develops subject-specific information and data interpretation for economic impact, demographic, transportation, industry and issue studies. She is involved in the planning and design of projects and performs research, data collection and organization, analysis and report preparation. Her work focuses on demographics, industry clusters, and occupational and industry contribution analyses. Ms. Sedgwick is also proficient at conducting geospatial analysis and working with IMPLAN.

Ms. Sedgwick joined the LAEDC in June of 2008 as an Economic Research Assistant with the Kyser Center for Economic Research. In that role she assisted both Economic Research and the Consulting Practice of the LAEDC with data collection and research covering the State of California, Southern California and its counties.

Before joining the LAEDC, Ms. Sedgwick managed an industrial and steel supply company located in the Inland Empire. There she identified and targeted a diverse customer base, and analyzed product and customer patterns in the local industrial market to successfully increase revenues.

A Southern California native, Ms. Sedgwick received her Bachelor of Arts in Economics from the University of Southern California (USC) with a minor in Architecture. She is actively involved with local animal rescue organizations and volunteers annually as a mentor to undergraduate students selected for the USC Dornsife Gateway Internship Program. ❖
